

Abstract

A multipurpose hand-held implement, comprising at least two components which can be locked in a closed position and then form a compact, essentially closed body, in the case of which the two components, with preferably confluent contours, are directed towards one another. In the closed position, the body forms the handle for actuating utensils, such as a knife, staple remover or cutter, which are accommodated in the components in a set-back manner, such that they can be pushed out. The two components are preferably connected to one another in an articulated manner and, after release of the locking means, can be moved relative to one another in order to actuate, for example, a stapler, a hole puncher or a pair of scissors. Further utensils, for example a magnifying glass, a pointer or a laser pointer may be accommodated in the components.
